

Working with OpenID Connect on the Client

Kevin Dockx

@KevinDockx | <http://blog.kevindockx.com/>

The Right Flow for the Right Client

The flow that's used for authentication depends on the **response_type** that's requested

Authorization Code (code)

Confidential clients

Implicit (id_token & id_token token)

Public clients

Hybrid (code id_token, code token & code id_token token)

Confidential clients, or public if you send the auth code to the server, not to the user agent

Helper Components

For **ASP .NET**: Microsoft OpenID Connect Authentication Middleware

NuGet: `Microsoft.OWIN.Security.OpenIdConnect`

For **JavaScript**: oidc client & oidc token manager

<https://github.com/IdentityModel/oidc-client>

<https://github.com/IdentityModel/oidc-token-manager>

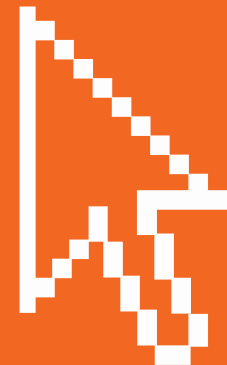

OpenID Connect Hybrid Flow

Learn how to use the Hybrid flow
from ASP .NET MVC

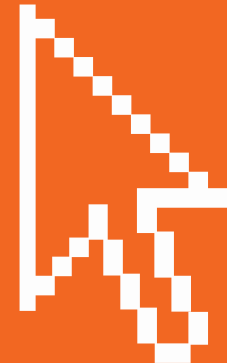

Logging Out (MVC)

Learn how to log out of an ASP .NET MVC application

Transforming Claims (MVC)

Learn how to transform what's in the token, in ASP .NET MVC

Authorizing Access (MVC)

Learn how to authorize parts of the application for the user in ASP .NET MVC

OpenID Connect Implicit Flow

Learn how to use the Implicit Flow
from Angular

Logging Out (Angular)

Learn how to log out of an Angular application

Authorizing Access (Angular)

Learn how to authorize parts of the application for the user in Angular

The UserInfo Endpoint (Angular)

Learn how to work with the UserInfo endpoint from Angular

The UserInfo Endpoint (MVC)

Learn how to work with the UserInfo endpoint from ASP .NET MVC

Summary

Hybrid flow: confidential clients

Implicit flow: public clients

Use the UserInfo endpoint to obtain more information on the user

Claims can be used for authorization
